AZterknot Fungicide Provides Excellent Disease Control and Plant Health Benefits to Potato Growers

AZterknot fungicide is an excellent tool for potato growers. AZterknot fungicide harnesses the plant health benefits of Reynoutria extract (bio fungicide), the disease-fighting power of azoxystrobin and the ease of use of Vive’s patented Allosperse Delivery System.

According to Jonathan Adamson, Western Region Sales Manager at Vive Crop Protection, “When growers are looking for disease control and plant health benefits to keep potatoes healthy and strong late into the season, they should look to a foliar application of AZterknot. In both research trials and from grower experience, we’ve seen that crops stay greener longer and have less disease later in the season.”

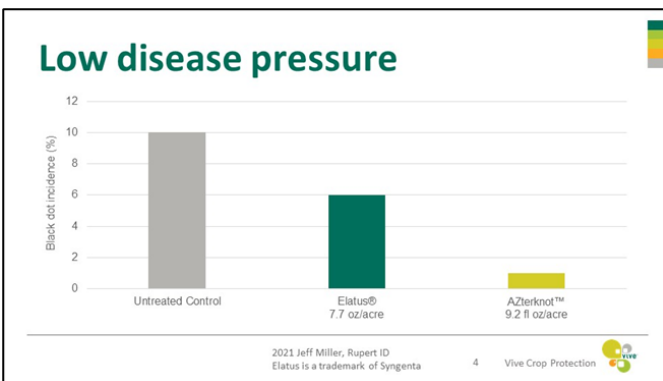

In the picture above, both applications were applied foliar in a trial near Erskine, MN on July 28, 2021. The AZterknot treated potatoes were more uniform, had a higher marketable yield, and an increased tuber count.

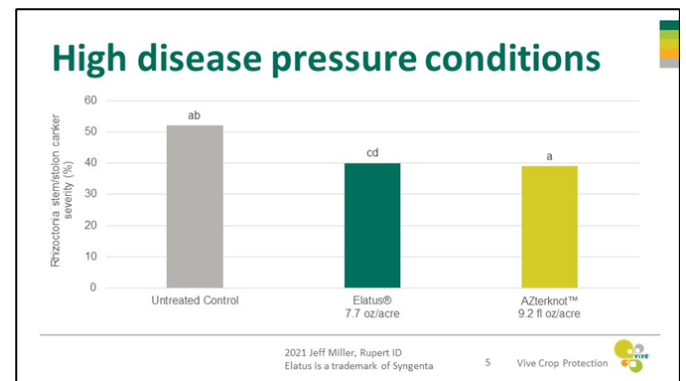

Adamson continues, “If growers are looking to use an in-furrow application, there’s really no need to pay more for Elatus when AZterknot provides the same or better disease control with two modes of action.”

Research done by Jeff Miller in Rupert, ID showed that AZterknot fungicide provided the same or better disease control as Elatus® when applied in-furrow.

In low disease pressure, AZterknot reduced black dot incidence to nearly zero.

While in high rhizoctonia disease pressure, AZterknot performed the same as Elatus.

Why choose AZterknot fungicide?

- Systemic, broad-spectrum control of yield-robbing diseases
- Excellent choice for resistance management (Group 11 and group P5)
- Activates the plant’s natural defenses
- Improves plant health and decreases plant stress
- Improves quality and yield
- Flexible application options – in-furrow, foliar, chemigation or mixed with foliar feeds
- Allosperse enables this chemical + biological combination with no clogging, no stress, and no added equipment
